

Installing React Native on Linux Mint

React Native is not downloaded as a standalone program. It is installed inside your project with a single command. On Linux Mint, follow these steps in order:

1. Install Node.js

```
curl -o- https://raw.githubusercontent.com/nvm-sh/nvm/master/install.sh | bash
```

Close the terminal and open it again, then run:

```
nvm install --lts
```

2. Download React Native (with Expo) and create the project

```
npx create-expo-app@latest MyApp
```

This command automatically downloads React Native and everything it needs.

3. Run the project

```
cd MyApp  
npx expo start
```

Then install the **Expo Go** app on your phone and scan the QR code.
